Straw Mulcher

The Cutmans Engineering Straw Mulcher is designed to apply mulch to vineyards and orchards to reduce the loss of water.

- Handles one big square or two round bales.
- 1600mm overall width enables mulching of narrow vineyard rows.
- Adjustable Floor Chain tension.
- Fully hydraulic operation reduces the number of mechanical components, reducing wear/tear and downtime/maintenance costs.
- Cross Conveyor deposits material to right of machine, but can be removed to effect deposit of material in centre of row.
- Cross Conveyor belt fitted with flexible fingers to assist feed of material from the conveyor to the ground.
- Spring Mounted to reduce shock loading and improved on-road handling.
- Heavy duty blades tease out hay at a controlled rate.
- Rear platform cradles the 2nd round bale within a bale retention mechanism that enables the rear platform to be raised to reduce the length of the machine for turning between rows in narrow vineyards, without releasing the bale for feed to the rotors. The bale retention mechanism releases the 2nd round bale as required for mulching, with the raising of the rear platform then assisting release of the 2nd bale and guiding the bale towards rotors for mulching.
- TLC rims and tyres assist floatation.

The Cutmans Engineering products are well known for their solid construction and durability.
